5-20V -> 5V

Must connect at only one point (P/A GND to GND)

5V -> 3.3V

TPS25751 GUI: GPIO2 = Cable_Orientation_Event, Open Drain disabled (push-pull)
-> HD3SS3212 SEL: L = CC1 (port B), H = CC2 (port C)
If lanes end up swapped: invert GPIO2 in GUI.

Set as plugevent_port in GUI, and Open Drain disabled, on GPIO1

Data pins not used on input

20V Power Negotiation

Switched on purpose for routing, supported by the chip

Can't have SuperSpeed, using D+/- on ch334 and SS on GL chip would apparently cause problem
